Human Development Index (HDI) Prediction using Machine Learning

Define Problem Statements (Customer Problem Statement Template)

Problem Statement (PS)	I am (Customer)	I'm trying to	But Because	Which makes me feel
PS-1	A government policymaker	Assess the development level of my country and identify areas needing improvement	Human development depends on multiple indicators like health, education, and income, making manual analysis difficult	Unsure about where to prioritize development efforts
PS-2	A researcher	Predict the Human Development Index (HDI) category of different countries	Large datasets and multiple socioeconomic indicators are complex to analyze manually	Frustrated by the time required for accurate analysis
PS-3	An economist	Compare countries based on their human development performance	Different countries have varying values for life expectancy, education, and GNI, making comparisons challenging	Less confident in making evidence-based conclusions

PS-4	A student or educator	Learn how different socioeconomic indicators influence HDI	Relationships between health, education, and income are difficult to understand without visualization	Confused about the factors affecting human development
PS-5	An international development organization	Identify countries that require urgent development support	Development indicators change over time and require continuous monitoring	Concerned about making timely and effective policy decisions

Customer Problem Summary

Governments, researchers, educators, and international organizations need an efficient way to predict and analyze the **Human Development Index (HDI)** using key indicators such as **Life Expectancy, Mean Years of Schooling, Expected Years of Schooling, and Gross National Income (GNI) per capita**. Existing manual analysis is time-consuming and complex. A machine learning-based HDI prediction system provides quick, accurate, and data-driven insights, enabling better policy planning, international comparison, and informed decision-making.
